Soil lead around the former Exide plant, Vernon, California

Median soil lead among sampled homes in DTSC's Preliminary Investigation Area, by hexagon. Data current as of October 12, 2026.

Median soil lead (ppm)

- Below 80 (CA residential screening level)
- 80 - 299
- 300 - 399 (DTSC prioritization range)
- 400 - 999 (2017 cleanup priority level)
- 1,000 or more (hot spot level)

Map features

- Former Exide facility
- Preliminary Investigation Area (PIA)
- Fewer than 10 properties sampled

About this map

Each hexagon, roughly a quarter mile across, reports the median soil lead concentration among the residential properties DTSC sampled within it. Each property's value is a deliberately conservative estimate, the 95% upper confidence limit, drawn from 10 to 15 individually analyzed yard samples.

To protect privacy, hexagons with fewer than 10 properties are omitted; hatching marks those with fewer than 10 sampled.

Values reflect soil conditions at the time of sampling, which for most properties preceded cleanup, and do not measure human exposure or health outcomes. Properties whose owners declined testing are excluded, a gap that may not be random.
